1. INTRODUCTION

1.1 REPORT DESCRIPTION

This report has been designed to provide a comprehensive study of the global mercury market. It reveals actual data sets of quantitative medium-term prospects, as well as developments in production, trade, consumption and prices. The report also includes a comparative analysis of the largest consuming countries, revealing opportunities opened for producers and exporters across the globe. The forecast presents market perspectives to 2025.

Countries coverage: Worldwide - the report contains statistical data for 200 countries and includes detailed profiles of the 50 largest consuming countries (United States, China, Japan, Germany, United Kingdom, France, Brazil, Italy, Russian Federation, India, Canada, Australia, Republic of Korea, Spain, Mexico, Indonesia, Netherlands, Turkey, Saudi Arabia, Switzerland, Sweden, Nigeria, Poland, Belgium, Argentina, Norway, Austria, Thailand, United Arab Emirates, Colombia, Denmark, South Africa, Malaysia, Israel, Singapore, Egypt, Philippines, Finland, Chile, Ireland, Pakistan, Greece, Portugal, Kazakhstan, Algeria, Czech Republic, Qatar, Peru, Romania, Vietnam) + the largest producing countries.

Product coverage: Mercury, unwrought

Data coverage:

- Mercury market size and volume;
- Mercury market trends and prospects;
- Global mercury production and its dynamics;
- Per capita consumption;
- Breakdown of production by region and country;
- Medium term outlook;
- Mercury trade (exports/imports);
- Prices for mercury;
- Profiles of the main manufacturers.

The report will help you:

- Get a bigger picture of the market;
- Rewire your business around market trends;
- Devise your marketing strategy;
- Operate with increased effectiveness.

B

**Area: Total planted
Area: report**

When the estimate refers to particular crops, generally grains, it is recommended to treat the estimate as if it were a single crop, therefore, the area acres is recorded only for the crop reported.

Production data refers to the actual harvested production from the field or orchard and gardens, including any harvesting and threshing losses and that part of crop not harvested for any reason. Production therefore includes the quantities of the commodity sold in the market (marketed production) and the quantities consumed or used by the producers (auto-consumption).

Data refers to the area from which a crop is gathered. The area harvested, therefore, includes the area from which, although sown or planted, there was no harvest due to damage, failure, etc. It is usually not for temporary crops and sometimes gross for permanent crops.

The net area differs from the gross area transfer as the latter includes uncultivated patches, footpaths, ditches, headlands, shoulders, shelterbelts, etc. If the crop under consideration is harvested more than once during the year as a consequence of successive cropping (i.e. the same crop is sown or planted more than once in the same field during the year), the area is counted as many times as it is harvested.

On the contrary, the area harvested will be recorded only once in the case of successive crop gathering during the year from the same standing crops. With regard to mixed and associated crops, the area acres relating to each crop should be reported separately.

When the estimate refers to particular crops, generally grains, it is recommended to treat the estimate as if it were a single crop, therefore, the area acres is recorded only for the crop reported.

**Area: Net area
production: estimated
Area: production
value**

Data refers to the area from which a crop is gathered. The area harvested, therefore, includes the area from which, although sown or planted, there was no harvest due to damage, failure, etc. It is usually not for temporary crops and sometimes gross for permanent crops.

The net area differs from the gross area transfer as the latter includes uncultivated patches, footpaths, ditches, headlands, shoulders, shelterbelts, etc. If the crop under consideration is harvested more than once during the year as a consequence of successive cropping (i.e. the same crop is sown or planted more than once in the same field during the year), the area is counted as many times as it is harvested.

On the contrary, the area harvested will be recorded only once in the case of successive crop gathering during the year from the same standing crops. With regard to mixed and associated crops, the area acres relating to each crop should be reported separately.

When the estimate refers to particular crops, generally grains, it is recommended to treat the estimate as if it were a single crop, therefore, the area acres is recorded only for the crop reported.

Production data refers to the actual harvested production from the field or orchard and gardens, including any harvesting and threshing losses and that part of crop not harvested for any reason. Production therefore includes the quantities of the commodity sold in the market (marketed production) and the quantities consumed or used by the producers (auto-consumption).

B

3. MARKET OVERVIEW

3.1 MARKET VOLUME AND VALUE

The net area differs from the gross area because the latter includes uncultivated patches, bays, ditches, lowlands, shoulders, shelterbelts, etc. If the crop under consideration is harvested more than once during the year as a consequence of successive cropping (i.e. the same crop is sown or planted more than once in the same field during the year), the area is counted as many times as it is harvested.

On the contrary, the area harvested will be recorded only once in the case of successive crop gathering during the year from the same standing crops. With regard to mixed and associated crops, the area areas relating to each crop should be reported separately.

When the mixture refers to particular crops, generally grains, it is recommended to treat the mixture as if it were a single crop. Therefore, the area areas is recorded only for the crop reported.

Production data refers to the actual harvested production from the field or orchard and gardens, including any harvesting and threshing losses and that part of crop not harvested for any reason. Production therefore includes the quantity of the commodity sold to the market (marketed production) and the quantity consumed or used by the producers (auto-consumption).

When the production data available refers to a production period falling into two successive calendar years.

And if it is not possible to allocate the relative production to either of them, it is usual to refer to the production data of that year into which the bulk of the production falls. The harvested production per unit of harvested area for crop products. In most cases, yield data is not recorded but obtained by dividing the production data by the data on the area harvested.

The net area differs from the gross area because the latter includes uncultivated patches, bays, ditches, lowlands, shoulders, shelterbelts, etc. If the crop under consideration is harvested more than once during the year as a consequence of successive cropping (i.e. the same crop is sown or planted more than once in the same field during the year), the area is counted as many times as it is harvested.

On the contrary, the area harvested will be recorded only once in the case of successive crop gathering during the year from the same standing crops. With regard to mixed and associated crops, the area areas relating to each crop should be reported separately.

When the mixture refers to particular crops, generally grains, it is recommended to treat the mixture as if it were a single crop. Therefore, the area areas is recorded only for the crop reported.

3.2 CONSUMPTION BY COUNTRY

Data refers to the area from which a crop is gathered. The area harvested, therefore, includes the area from which, although sown or planted, there was no harvest due to damage, failure, etc. It is usually not for temporary crops and sometimes grass for permanent crops.

The net area differs from the gross area insofar as the latter includes uncultivated patches, forage, ditches, headlands, shoulders, shelterbelts, etc. If the crop under consideration is harvested more than once during the year as a consequence of successive cropping (i.e. the same crop is sown or planted more than once in the same field during the year), the area is counted as many times as it is harvested.

On the contrary, the area harvested will be recorded only once in the case of successive crop gathering during the year from the same standing crops. With regard to mixed and associated crops, the area sown relating to each crop should be reported separately.

When the mixture refers to particular crops, generally grains, it is recommended to treat the mixture as if it were a single crop. Therefore, the area sown is recorded only for the crop reported.

Production data refers to the actual harvested production from the field or orchard and gardens, including any harvesting and threshing losses and that part of crop not harvested for any reason. Production therefore includes the quantities of the commodity sold in the market (marketed production) and the quantities consumed or used by the producers (auto-consumption).

Figure 3: Consumption, by Country, 2016
(based on physical terms)

Source: ***

Global green leaf market revenue amounted to \$6,000 million USD in 2015, increasing by +13.7% against the previous year level. Overall, global green leaf market continues to indicate a pronounced growth, the market value increased at an average annual rate of +4.9% from 2007 to 2015. This trend pattern, however, indicated some volatile fluctuations throughout the analyzed period. The growth pace was the most rapid in 2013, when the market revenue increased by +18% from the previous year level. Over the period under review, the global green leaf market revenue peaked in 2015, and is likely to continue its growth in the immediate term.

Over the analyzed period, an increase in global green leaf consumption was primarily driven by popularity of healthy eating and growth of population. Furthermore, these key drivers are expected to continue propelling the green leaf output in the immediate term. This general positive trend was largely conditioned by a consistent expansion of the harvested area and yield gains of the yield figures.

Table 4: Per Capita Consumption, by Country, 2014-2016
(physical terms, physical terms/year)

Country	Production			Consumption			Population, million persons			Per Capita Consumption			CAGR, 2007-2016

3.3 MARKET OPPORTUNITIES BY COUNTRY

Global green leafy market revenue amounted to \$5,200 million USD in 2015, increasing by +13.2% against the previous year level. Overall, global green leafy market continues to indicate a pronounced growth; the market value increased at an average annual rate of +6.9% from 2007 to 2015. The trend pattern, however, indicated some noticeable fluctuations throughout the analyzed period. The growth pace was the most rapid in 2013, when the market revenue increased by +10% from the previous year level. Over the period under review, the global green leafy market revenue peaked in 2015, and is likely to continue its growth in the immediate term.

Over the analyzed period, an increase in global green leafy consumption was primarily driven by popularity of healthy eating and growth of population. Furthermore, these key drivers are expected to continue promoting the green leafy output in the immediate term. The general positive trend was largely conditioned by a sustained expansion of the harvested area and solid gains of the yield figures.

On the contrary, the area harvested will be recorded only once in the case of successive crop gathering during the year from the same standing crops. With regard to mixed and associated crops, the area acres relating to each crop should be reported separately.

When the mixture refers to particular crops, generally grains, it is recommended to treat the mixture as if it were a single crop, therefore, the area acres is recorded only for the crop reported.

Production data refers to the actual harvested production from the field or orchard and gardens, including any harvesting and threshing losses and that part of crop not harvested for any reason. Production therefore includes the quantities of the commodity sold in the market (marketed production) and the quantities consumed or used by the producers (own consumption).

When the production data available refers to a production period falling into two successive calendar years.

3.4 MARKET FORECAST TO 2025

The net area differs from the gross area because the latter includes uncultivated patches, banyans, ditches, lowlands, shoulders, shellholes, etc. If the crop under consideration is harvested more than once during the year as a consequence of successive cropping (i.e. the same crop is sown or planted more than once in the same field during the year), the area is counted as many times as it is harvested.

On the contrary, the area harvested will be recorded only once in the case of successive crop gathering during the year from the same standing crops. With regard to mixed and associated crops, the area areas relating to each crop should be reported separately.

When the mixture refers to particular crops, generally grains, it is recommended to treat the mixture as if it were a single crop. Therefore, the area areas is recorded only for the crop reported.

Production data refers to the actual harvested production from the field or orchard and gardens, including any harvesting and threshing losses and that part of crop not harvested for any reason. Production therefore includes the quantity of the commodity sold to the market (marketed production) and the quantity consumed or used by the producers (auto-consumption).

When the production data available refers to a production period falling into two successive calendar years.

And if it is not possible to allocate the relative production to either of them, it is usual to refer to the production data of that year into which the bulk of the production falls. The harvested production per unit of harvested area for crop products. In most cases, yield data is not recorded but obtained by dividing the production data by the data on the area harvested.

The net area differs from the gross area because the latter includes uncultivated patches, banyans, ditches, lowlands, shoulders, shellholes, etc. If the crop under consideration is harvested more than once during the year as a consequence of successive cropping (i.e. the same crop is sown or planted more than once in the same field during the year), the area is counted as many times as it is harvested.

On the contrary, the area harvested will be recorded only once in the case of successive crop gathering during the year from the same standing crops. With regard to mixed and associated crops, the area areas relating to each crop should be reported separately.

When the mixture refers to particular crops, generally grains, it is recommended to treat the mixture as if it were a single crop. Therefore, the area areas is recorded only for the crop reported.
